U.S. Application No. 09/828,865 Amdt. dated July 8, 2008

## **ABSTRACT**

A method to optimize a bandwidth of a digital television (DTV) transport stream and to determine transmission cycles for tables to be transmitted as part of the DTV transport stream, the method including; setting transmission cycles for event information tables (EITs) to be transmitted in sequence according to the following condition: transmission cycle (EITi-1) < transmission cycle (EITi), for i=1 and 2, a time span covered by EITi-1 being prior to a time span covered by EITi, where the transmission cycle for the EIT0 is set narrower than the transmission cycle for the EIT1; setting a transmission cycle for an extended text table ETT3 containing program description information associated with one of the event information tables other than the EIT0 and the EIT1, where the transmission cycle of the ETT3 is greater than a sum of the transmission cycle of the EIT1.
